Ig kappa chain precursor V region (4C11) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 30-Jun-1992 #sequence_revision 30-Jun-1992 #text_change 21-Jan-2000
C;Accession: PL0013
R;Cheng, H.L.; Sood, A.K.; Ward, R.E.; Kieber-Emmons, T.; Kohler, H.
Mol. Immunol. 25, 33-40, 198
A;Title: Structural basis of stimulatory anti-idiotypic antibodies.
A;Reference number: PL0011; MUID:88142863; PMID:3125424
A;Recession: PL0013
A;Molecule type: mRNA
A;Residues: 1-140 <CHE>
A;Experimental source: cell line 4C11
C;Comment: This protein is an anti-idiotypic antibody that induces an anti-phosphorylchc C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC complex of two polypeptides (P1) and two second polypeptides (P2) which CC are stably associated in an immunoglobulin like complex. P1 has an CC antigen-binding site located to the N terminus of immunoglobulin (Ig) Clight chain constant domain (CL domain), and P2 has an antigen-binding Site located to the N terminus of immunoglobulin (Ig) Clight chain constant domain (CL domain), and P2 has an antigen-binding CC site located to the N terminus of the CH1 domain (I) is useful for: CC (NEGF) receptor; reducing tumour growth; inhibiting angiogenesis; CC reducing endothelial cell proliferation; inhibiting angiogenesis; CC migration of human leukaemia cells; blocking interaction of a protein and clits ligand; promoting interactions between immune cells and target cells; CC and in vivo and in vitro for investigative, diagnostic or treatment complete cells; complete configuration. (I) is bivalent and bispecific, homogeneous complete configuration. (I) is bivalent and bispecific, homogeneous can in tetrameric form. The heavy chain constant domains which constitute the Fc region (e.g., CH2 and CH3 for an IgG molecule) of a natural containbody and which provide other antibody functions can be product. There is no requirement for processing in vitro to obtain the complete product. There is no requirement for processing in vitro to obtain the complete product. There is no requirement for processing in vitro to obtain the complete product. There is no requirement for processing in vitro to obtain the complete product. There is no requirement for processing in vitro to obtain the complete product. There is no requirement for processing in our complete product. There is no requirement for processing in our complete complete product. There is no requirement for processing in our complete complete product. The method of the inventible domain in one polypeptide chain, described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The bispecific antigen-binding proteins block activation of the VEGF receptor and are useful for reducing or inhibiting VEGF-induced cellular functions such as mitogenesis of vascular endothelial cells and migration of leukaemia cells. The antibodies are useful for treating tumours and for in vivo or in vitro for investigative and diagnostic methods. This sequence represents a mouse protein relating to the bispecific antibodies that bind to the VEGF receptors of the invention.
